

Computer Programming (XSCH3307)

The ability to analyse a problem, design an efficient solution and implement that solution in the form of a computer program is assessed in the Computer Programming examination. This entire paper is considered to be the General Section of the Scholarship examination for Computer Science students. Candidates will be required to
answer both questions on this two-hour examination.

By allowing students one hour to answer each question, the expectation is that successful candidates will be able to provide considered answers that demonstrate deep insight, rather than
merely providing working solutions. While the questions will draw on module-specific knowledge in areas such as algorithms, and data structures, the questions are also intended to challenge advanced aspects of programming.
